A new graph-theory based FOF group finder and its application to the updated 2MRS

We present the galaxy group catalog for the newly completed 2MASS Redshift Survey up to a magnitude limit of $K < 11.75$. Consisting of $\sim 45\,000$ redshifts, including 1 041 previously unpublished redshifts mostly distributed along the Zone of Avoidance. The galaxy group catalog is generated by using a novel, graph theory based, modified version of the friends-of-friends algorithm. The results and methods have been thoroughly interrogated against previous 2MRS group catalogs by making use of cutting edge visualization techniques including immersive facilities, a digital planetarium, and virtual reality. The final catalog consists of $\sim 3\,000$ groups resulting in the most complete "whole-sky" galaxy group catalog to date.

Serdecznie zapraszam,
Agnieszka Majczyna
